OIL ANALYSIS AWD-TOR FLUID

# TORSEN DIFFERENTIAL

A Torsen differential belongs to the group of limited slip differentials and is derived from the words Torque and sense.

It is a purely mechanical differential that works without sensors and can often be found in Audi Quattro models today.

It compensates for speed differences and can distribute the torque unevenly. The ratio in which the torque can be distributed between the two sides is called the torque-bias ratio, or TBR for short.

While with the open differential, the torque is either equally distributed to both wheels or lost on the tractionless wheel, the 100 percent limited-slip differential always distributes the power in the same ratio. The Torsen differential, on the other hand, multiplies the force that can still be delivered on the low-traction wheel by the ratio of the TBR to the wheel with greater traction or slower rotation.

# RESULTS OF THE OIL ANALYSIS

<b>Parameters Measurement methods</b>	<b>Unit</b>	<b>VW G055145A2</b>	<b>RAVENOL AWD-TOR Fluid</b>
Appearance/colour	-	yellow-brown	yellow-brown

Copper Corrosion ASTM D130: 2012		2c	1a

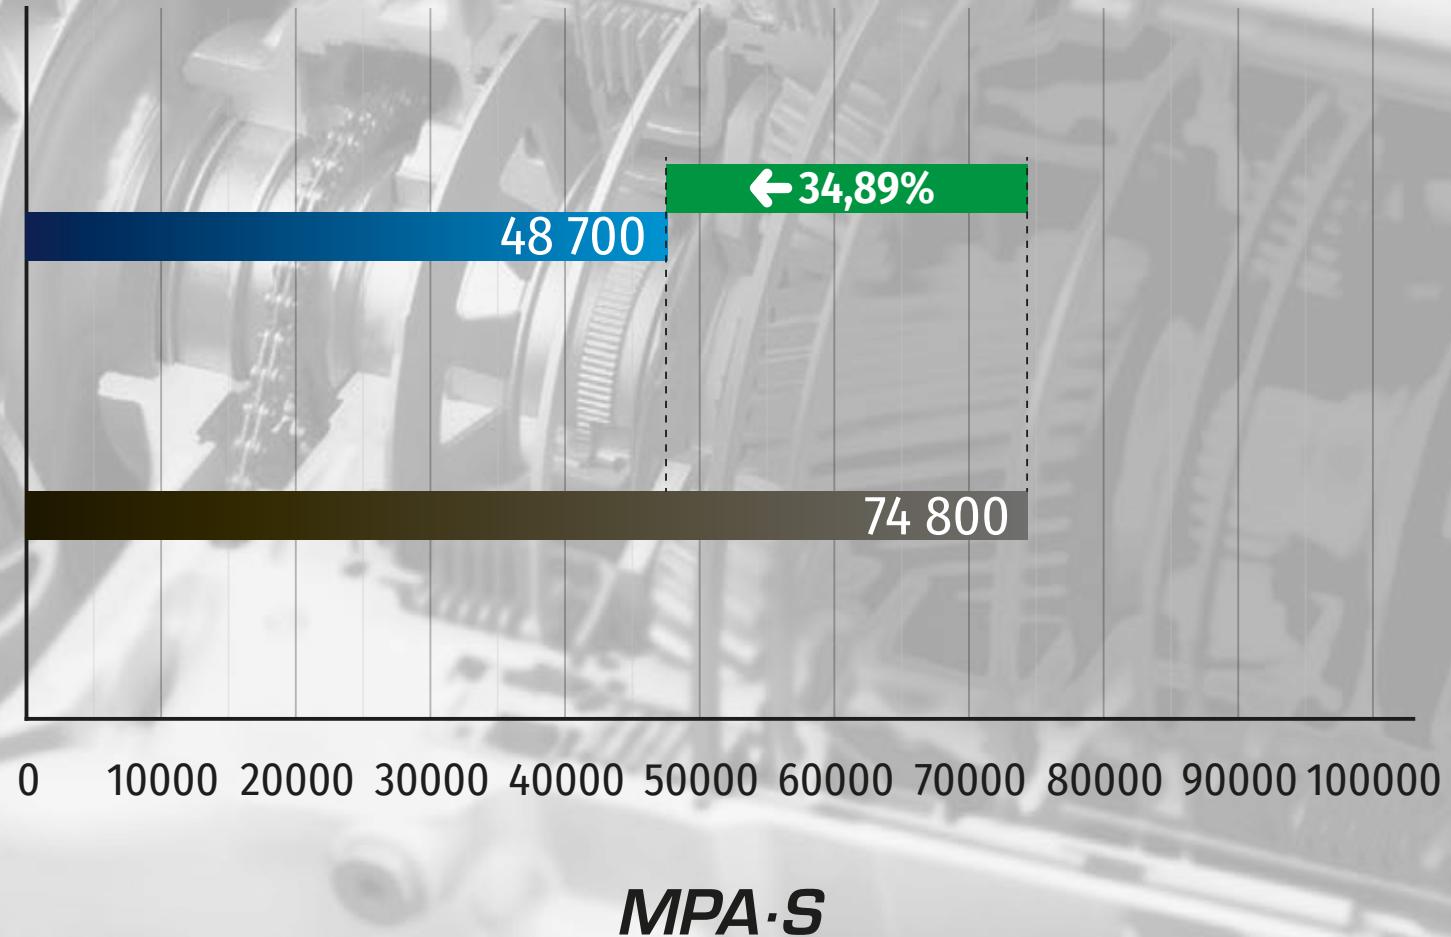

# BROOKFIELD -40°C

ASTM D 2983

The lower the dynamic viscosity, the better. The Torsen differential will begin to work faster, the oil will circulate more quickly and there is no wear caused by a low temperature start. With regard to the parameters for dynamic viscosity at minus 40 °C, RAVENOL AWD-TOR Fluid delivers 34,89% higher performance than the original oil VW G055145A2.
